SAFELY DETECTING POTENTIAL THREATS

Soft Target security personnel need a way to safely detect potential threats concealed in vehicles, on people, and in their belongings that maintains personal privacy and does not involve physically searching them or impacting their flow of travel. Solutions to this challenging problem are currently limited, which is why the Department of Homeland Security (DHS) Science and Technology Directorate (S&T) is developing a layered and integrated capability to detect potential threat items at the speed of the traveling public.

LEVERAGING RESEARCH AND DEVELOPMENT ACROSS PARTNERSHIPS

The S&T Physical Security Program is working in collaboration with our component stakeholders, end-users, and our technology development partners to close the security gap through innovative technologies designed to work together and provide screening coverage of unstructured crowds:

- **Event Security Decision Support Tools**: A Special Event Assessment Rating (SEAR) events protection portal, containing security decision-support tools for use by the DHS Cybersecurity and Infrastructure Security Agency’s Infrastructure Security Division and DHS Regional Protective Security Advisors.

- **Forensic Video Exploitation & Analysis (FOVEA)**: A “user-in-the-loop” tool capable of quickly capturing the surrounding circumstances of a leave-behind event, allowing security personnel to clear 30-50 percent of suspicious packages without necessitating an emergency response.

- **Standoff Detection**: Non-invasive imaging sensors using complementary parts of the electromagnetic spectrum, which can safely scan people and their belongings within soft-target venues and crowded places without physically contacting them. Also, chemical detectors capable of finding trace explosive or narcotic materials on vehicles while maintaining passenger safety.

SECURING SURFACE TRANSPORTATION, SOFT-TARGET VENUES, AND CROWDED PLACES

S&T is developing this technology for use in the surface transportation environment because it is the most difficult security challenge. However, these tools will also have applications to other parts of the Homeland Security Enterprise. They can be used to monitor events that take place at stadiums, convention centers, and schools and can enhance security in any soft-target venue or environment with unstructured crowds. It is impossible for law enforcement officials to be everywhere at all times; thus, S&T is developing these tools to serve as a force-multiplier, assisting security personnel in keeping the public safe.
