Test Results for Forensic Media Preparation Tool: Drive eRazer Pro SE Bundle 12/03/2009

NCJ 231621
Test Results for Forensic Media Preparation Tool:
Drive eRazer Pro SE Bundle 12/03/2009
Introduction

The Computer Forensics Tool Testing (CFTT) program is a joint project of the National Institute of Justice (NIJ), the research and development organization of the U.S. Department of Justice, and the National Institute of Standards and Technology’s (NIST’s) Office of Law Enforcement Standards and Information Technology Laboratory. CFTT is supported by other organizations, including the Federal Bureau of Investigation, the U.S. Department of Defense Cyber Crime Center, the U.S. Internal Revenue Service Criminal Investigation Division Electronic Crimes Program, the U.S. Department of Homeland Security’s Bureau of Immigration and Customs Enforcement, the U.S. Customs and Border Protection and the U.S. Secret Service. The objective of the CFTT program is to provide measurable assurance to practitioners, researchers and other users that the tools used in computer forensics investigations provide accurate results. Accomplishing this requires the development of specifications and test methods for computer forensics tools and subsequent testing of specific tools against those specifications.

Test results provide the information necessary for developers to improve tools, users to make informed choices and the legal community and others to understand the tools’ capabilities. The CFTT program’s approach to testing computer forensic tools is based on well-recognized methodologies for conformance and quality testing. The specifications and test methods are posted on the CFTT Web site for review and comment by the computer forensics community.

This document reports the results from testing Drive eRazer Pro SE Bundle, against the Forensic Media Preparation Tool Test Assertions and Test Plan Version 1.0, available at the CFTT Web site.

Test results for other devices and software packages using the CFTT tool methodology can be found on NIJ’s computer forensics tool testing Web Site.

How to Read This Report

This report is divided into four key sections. Section 1 is a summary of the results from the test runs. This section is sufficient for most readers to assess the suitability of the tool for the intended use. The remaining sections of the report describe how the tests were conducted and provide documentation of test case run details that support the report summary. Section 2 gives justification for the selection of test cases from the set of possible cases defined in the test plan for forensic media preparation tools. The test cases are selected, in general, based on features offered by the tool. Section 3 lists hardware and software used to run the test cases with links to additional information about the items used. Section 4 contains a description of each test case. The description of each test run lists all test assertions used in the test case, the expected result and the actual result.
Test Results for Forensic Media Preparation Tool

Tool Tested: Drive eRazer Pro SE Bundle
Version: 31520–0003–0001, 12/03/09
Serial No. 21–036837–C
Run Environments: Custom

Supplier: CRU–DataPort/WiebeTech
8201 E. 34th St. North #909
Wichita, KS 67226
U.S.A.

Tel: 866–744–8722
Fax: 316–744–1398
WWW: CRU Wiebetech Website

1. Results Summary

The Drive eRazer Pro SE Bundle disk wiping tool supports the use of both the ATA WRITE command and the ATA SECURITY ERASE command for erasing hard drives. The use of both commands was tested.

In all the test cases run against Drive eRazer Pro SE Bundle, all visible sectors were successfully overwritten. For the test cases that used drives containing an HPA or DCO, the tool removed HPAs and DCOs and overwrote the previously hidden sectors with one exception. For test case, FMP–03–DCO–HPA, it was observed that the device removed the HPA while overwriting sectors that were previously hidden, but left the DCO intact on the target drive leaving the sectors hidden by the DCO unchanged. This behavior was limited to Fujitsu drives.

The following table provides a quick overview of the test case results:

<table>
<thead>
<tr>
<th>Test Case</th>

</tbody>
</table>
2. Test Case Selection

The Drive eRazer Pro SE Bundle was tested for its ability to overwrite sectors. The device supports two modes and performs the following tasks: (1) in Single-pass mode the device overwrites target drives using the ATA WRITE command and (2) in Secure Erase mode the device issues the ATA SECURITY ERASE command to the disk drive to remove content from the disk.

The test cases were selected from cases defined by Forensic Media Preparation Tool Test Assertions and Test Plan Version 1.0 and applicable to features supported by this tool.

The following cases were used in testing the Drive eRazer Pro SE Bundle:

<table>

The following source interfaces were used in testing: ATA28, ATA48, SATA28, and SATA48.
3. Test Materials

3.1 Support Software
Several programs were used in the setup and analysis of the test drives. These include hdat2 (download from: hdat2 download page), dsumm (download from: CFTT Project Web Site) and diskwipe from FS–TST Release 2.0 (download from: CFTT fs-tst20.zip download page).

The hdat2 program is used to create, remove and document hidden areas on a drive.

The diskwipe program initializes a hard drive with known content.

The dsumm program analyzes the content of a hard drive. It produces a summary of disk contents in terms of counts for each byte value present on the drive. For example, if a drive can contain 10 GB (19531250 sectors of 512 bytes per sector) and the drive is wiped with zero bytes, then dsumm reports 10,000,000,000 zero bytes. The program also prints the first sector found with printable ASCII content.

The ransum program examines a hard drive to identify sectors that do not contain the content written to the drive by the diskwipe program. The ransum output is a list of sector ranges classified as either overwritten or unchanged.

3.2 Test Drive Creation

The following steps are used to setup a test drive:

1. The drive is initially filled with known content by the diskwipe program from FS–TST. The diskwipe program writes the sector address to each sector in both C/H/S and LBA format. The remainder of the sector bytes is set to a constant fill value unique for each drive. The fill value is noted in the diskwipe tool log file.
2. The dsumm program analyzes the drive contents. This documents the content of the drive. Each sector has unique content after the setup.
3. If the drive is intended for hidden area tests (FMP–03, FMP–04), an HPA, a DCO or DCO+HPA are created.
4. The drive size after creation of a hidden area is recorded.

3.3 Test Drive Analysis

The following steps are used to analyze a test drive after it has been wiped by the tool under test:

1. The size of the drive is recorded. This determines if the tool changes the size of a hidden area.
2. Any hidden areas still present on the drive are removed.
3. The `dsumm` program is run to determine the final content of the drive.
4. The `ransum` program is run to classify sectors as either overwritten or unchanged.

### 3.4 Test Drives

The following hard drives were used in testing. The column labeled Test Case identifies the test case. The fill value written by `diskwipe` to initialize the drive is reported in the column labeled Target Fill. The column labeled Sectors is the size of the drive with no DCO or HPA. The column labeled Model is the model of the drive as returned by the ATA IDENTIFY DEVICE command. The column labeled Serial # is the serial number as returned by the ATA IDENTIFY DEVICE command.

The table that follows lists the drive configurations for hidden sector test cases. The column labeled Test Case identifies the test case. The column labeled Size is the number of visible sectors presented to the device for the test case. The column labeled Hidden is the size in sectors of the hidden area. The size of the drive including both visible and hidden sectors is reported in the column labeled Total.

### 4. Test Results

The main item of interest for interpreting the test results is determining the conformance of the tool under test with the test assertions. Conformance with each assertion tested by a
given test case is evaluated by examining the Log Highlights box of the test report summary.

4.1 Test Results Report Key

A summary of the actual test results is presented in this report. The following table presents a description of each section of the test report summary.

<table>
<thead>
<tr>
<th>Heading</th>
<th>Description</th>

### 4.2.4 FMP–01–SATA48

**Test Case FMP–01–SATA48 Drive eRazer Pro SE Bundle 12/03/2009**

**Case Summary:** FMP–01. Overwrite visible sectors using WRITE commands.

**Assertions:** FMP–CA–01 All visible sectors shall be overwritten with the specified benign data.

**Tester Name:** Csr

**Source Setup:**
- Initial setup size: 390721968 from total of 390721968 (with 0 hidden)
- IDE disk: Model (SAMSUNG SP2004C) serial # (S07GJ1ULC07896)

4.2.9 FMP–03–DCO

Test Case FMP–03–DCO Drive eRazer Pro SE Bundle 12/03/2009

Case Summary: FMP-03. Overwrite hidden sectors using WRITE commands.

Assertions: FMP-CA-01 All visible sectors shall be overwritten with the specified benign data.
FMP-AO-01 If there is a hidden area present and the tool supports overwriting sectors contained in a hidden area, then all sectors contained in the hidden area shall be overwritten with the specified benign data.
FMP-AO-02 A hidden area may optionally be removed from the storage device.

Test Case FMP-04-DCO-HPA Drive eRazer Pro SE Bundle 12/03/2009

Case Summary: FMP-04. Overwrite hidden sectors using an ERASE command.

Assertions:
- FMP-AO-01 If there is a hidden area present and the tool supports overwriting sectors contained in a hidden area, then all sectors contained in the hidden area shall be overwritten with the specified benign data.
- FMP-AO-02 A hidden area may optionally be removed from the storage device.
- FMP-AO-03 If the tool supports overwrite command selection and an ERASE command is selected then all visible sectors are overwritten.

Tester Name: csr

Analysis host: frank

Test host: none

Test date: Thu Feb 18 14:16:55 2010

Test drive: 2A-IDE

Source Setup:
- Size with DCO: 480234752 245.88 GB (10000000 sectors in DCO)
- Size with HPA: 465234752 238.20 GB (15000000 sectors in HPA)
- Initial setup size: 465234752 from total of 490234752 (with 25000000 hidden)
- IDE disk: Model (Maxtor 7Y250P0) serial # (Y63FSHTE)

**Analysis:** Expected results achieved
About the National Institute of Justice

A component of the Office of Justice Programs, NIJ is the research, development and evaluation agency of the U.S. Department of Justice. NIJ’s mission is to advance scientific research, development and evaluation to enhance the administration of justice and public safety. NIJ’s principal authorities are derived from the Omnibus Crime Control and Safe Streets Act of 1968, as amended (see 42 U.S.C. §§ 3721–3723).

The NIJ Director is appointed by the President and confirmed by the Senate. The Director establishes the Institute’s objectives, guided by the priorities of the Office of Justice Programs, the U.S. Department of Justice, and the needs of the field. The Institute actively solicits the views of criminal justice and other professionals and researchers to inform its search for the knowledge and tools to guide policy and practice.

Strategic Goals

NIJ has seven strategic goals grouped into three categories:

Creating relevant knowledge and tools
1. Partner with state and local practitioners and policymakers to identify social science research and technology needs.
2. Create scientific, relevant, and reliable knowledge—with a particular emphasis on terrorism, violent crime, drugs and crime, cost-effectiveness, and community-based efforts—to enhance the administration of justice and public safety.
3. Develop affordable and effective tools and technologies to enhance the administration of justice and public safety.

Dissemination
4. Disseminate relevant knowledge and information to practitioners and policymakers in an understandable, timely and concise manner.
5. Act as an honest broker to identify the information, tools and technologies that respond to the needs of stakeholders.

Agency management
6. Practice fairness and openness in the research and development process.
7. Ensure professionalism, excellence, accountability, cost-effectiveness and integrity in the management and conduct of NIJ activities and programs.

Program Areas

In addressing these strategic challenges, the Institute is involved in the following program areas: crime control and prevention, including policing; drugs and crime; justice systems and offender behavior, including corrections; violence and victimization; communications and information technologies; critical incident response; investigative and forensic sciences, including DNA; less-than-lethal technologies; officer protection; education and training technologies; testing and standards; technology assistance to law enforcement and corrections agencies; field testing of promising programs; and international crime control.

In addition to sponsoring research and development and technology assistance, NIJ evaluates programs, policies, and technologies. NIJ communicates its research and evaluation findings through conferences and print and electronic media.
