## Introduction

The Computer Forensics Tool Testing (CFTT) program is a joint project of the National Institute of Justice (NIJ), the Department of Homeland Security (DHS), and the National Institute of Standards and Technology Law Enforcement Standards Office (OLEs) and Information Technology Laboratory (ITL). CFTT is supported by other organizations, including the Federal Bureau of Investigation, the U.S. Department of Defense Cyber Crime Center, U.S. Internal Revenue Service Criminal Investigation Division Electronic Crimes Program, and the U.S. Department of Homeland Security's Bureau of Immigration and Customs Enforcement, U.S. Customs and Border Protection and U.S. Secret Service. The objective of the CFTT program is to provide measurable assurance to practitioners, researchers, and other applicable users that the tools used in computer forensics investigations provide accurate results. Accomplishing this requires the development of specifications and test methods for computer forensics tools and subsequent testing of specific tools against those specifications.

Test results provide the information necessary for developers to improve tools, users to make informed choices, and the legal community and others to understand the tools' capabilities. The CFTT approach to testing computer forensics tools is based on well-recognized methodologies for conformance and quality testing. The specifications and test methods are posted on the CFTT Web site (<http://www.cftt.nist.gov/>) for review and comment by the computer forensics community.

This document reports the results from testing X-Ways Forensics Version 16.2 SR-5 against the *Digital Data Acquisition Tool Assertions and Test Plan Version 1.0*, available at the CFTT Web site (<http://www.cftt.nist.gov/DA-ATP-pc-01.pdf>).

Test results from other tools can be found on NIJ's computer forensics tool testing Web page, <http://www.ojp.usdoj.gov/nij/topics/technology/electronic-crime/cftt.htm>.

## How to Read This Report

This report is divided into five sections. The first section is a summary of the results from the test runs. This section is sufficient for most readers to assess the suitability of the tool for the intended use. The remaining sections of the report describe how the tests were conducted, discuss any anomalies that were encountered and provide documentation of test case run details that support the report summary. Section 2 gives justification for the selection of test cases from the set of possible cases defined in the test plan for Digital Data Acquisition tools. The test cases are selected, in general, based on features offered by the tool. Section 3 describes in more depth any anomalies summarized in the first section. Section 4 lists hardware and software used to run the test cases with links to additional information about the items used. Section 5 contains a description of each test case run. The description of each test run lists all test assertions used in the test case, the expected result and the actual result. Please refer to the vendor documentation for guidance on using the tool.

# Test Results for Digital Data Acquisition Tool

Tool Tested: X-Ways Forensics  
Software Version: 16.2 SR-5  
Runtime Environment Windows XP and Windows 7

Supplier: X-Ways Software Technology AG

Address: X-Ways AG  
Agrippastr. 37-39  
50676 Cologne  
Germany

Tel: +49 221-420 486 5  
Fax: +49 3212-123 2029  
E-mail: [mail@x-ways.com](mailto:mail@x-ways.com)  
WWW: <http://www.x-ways.com>

## 1 Results Summary

X-Ways Forensics version 16.2 SR-5 is designed to image, clone and restore data from hard drives and other secondary storage. Except for three test cases involving NTFS partitions, the tool acquired test media completely and accurately. When the tool cloned an NTFS partition (test case DA-02-NT) and when the images of previously acquired NTFS partitions were restored (test cases DA-14-NT and DA-14-NT-ALT), some sectors on the target partitions did not match the partitions that were acquired. The differences appear to be changes made by *Windows*; an artifact of the tool's operating environment (Windows 7 and Windows XP). The tool had no control over these changes. The vendor references this issue in the X-Ways user manual; "An image is usually preferable to a clone, as all data (and metadata such as timestamps) in an image file is protected from the operating system."

Additional observations:

- The tool allows the user to restore the image of a partition. For FAT32 and exFAT file system types, if the user selects a Windows drive letter (e.g., c: or e:) or a partition containing a file system as the destination, Windows may make some changes to file system metadata on the destination partition causing a difference of several sectors between the source partition and the destination partition it was restored to. No changes are made if a partition with no file system is selected as the destination. *This is not an issue with the tool*; this result is noted to make the reader aware of the difference between restoring an image of a partition to a logical drive vs. restoring an image of a partition to a partition formatted with a file system vs. restoring an image of a partition to an unformatted destination partition.

- Selecting to acquire a Windows drive letter or logical drive (e.g., c: or e:) does not acquire volume slack. To acquire volume slack the partition must be selected and not the drive letter. This result is noted to make the reader aware of the difference between choosing a logical vs. a partition acquisition.

Refer to sections 3.1, 3.2 and 3.3 for more details.

## 2 Test Case Selection

Test cases used to test disk imaging tools are defined in *Digital Data Acquisition Tool Assertions and Test Plan Version 1.0*. To test a tool, test cases are selected from the *Test Plan* document based on the features offered by the tool. Not all test cases or test assertions are appropriate for all tools. There is a core set of base cases (e.g., DA-06 and DA-07) that are executed for every tool tested. Tool features guide the selection of additional test cases. If a given tool implements a feature then the test cases linked to that feature are run. Table 1 lists the testable features of X-Ways Forensics 16.2 SR-5 and the linked test cases selected for execution. Table 2 lists the features not available in X-Ways Forensics 16.2 SR-5 and the test cases not executed.

**Table 1. Selected Test Cases**

<b>Supported Optional Feature</b>	<b>Cases selected for execution</b>
Create a clone during acquisition	01
Create an unaligned clone from a digital source	02
Create a truncated clone from a physical device	04
Base Cases	06 & 07
Read error during acquisition	09
Create an image file in more than one format	10
Destination Device Switching	13
Create a clone from an image file	14 & 17

**Table 2. Omitted Test Cases**

<b>Unsupported Optional Feature</b>	<b>Cases omitted (not executed)</b>
Create cylinder aligned clones	03, 15, 21 & 23
Device I/O error generator available	05, 11 & 18
Create an image of a drive with hidden sectors	08
Insufficient space for image file	12
Create a clone from a subset of an image file	16
Fill excess sectors on a clone acquisition	19
Detect a corrupted (or changed) image file	24 & 25
Fill excess sectors on a clone device	20, 21, 22 & 23
Convert an image file from one format to another	26

Some test cases have different forms to accommodate parameters within test assertions. These variations cover the acquisition interface to the source media, the type of digital

object acquired, image file format and the execution environment. In addition, the types of hash algorithms calculated, image file segment size and the type of hardware write blocker used were varied between test cases.

The following source access interfaces were tested: ATA28, ATA48, SATA28, SATA48, SCSI, FW, and USB. These are noted as variations on test cases DA-01, DA-06 and DA-14.

The following digital sources were tested: partitions (FAT12, FAT16, FAT32, FAT32X, exFAT, NTFS), compact flash (CF), and thumb drive (Thumb). There are two FAT 32 variations testing acquisition of both FAT 32 partition codes 0x0B (FAT32) and 0x0C (FAT32X). These digital source types are noted as variations on test cases DA-02 and DA-07.

The following image file types are supported by the tool: E01, compressed and encrypted. These were tested as alternate image file formats and are noted as variations on test case DA-10.

### 3 Results by Test Assertion

A test assertion is a verifiable statement about a single condition after an action is performed by the tool under test. A test case usually checks a group of assertions after the action of a single execution of the tool under test. Test assertions are defined and linked to test cases in *Digital Data Acquisition Tool Assertions and Test Plan Version 1.0*.

Table 3 summarizes the test results for all the test cases by assertion. The column labeled **Assertions Tested** gives the text of each assertion. The column labeled **Tests** gives the number of test cases that use the given assertion. The column labeled **Anomaly** gives the section number in this report where any observed anomalies are discussed.

**Table 3. Assertions Tested**

<b>Assertions Tested</b>	<b>Tests</b>	<b>Anomaly</b>
AM-01 The tool uses access interface SRC-AI to access the digital source.	36	
AM-02 The tool acquires digital source DS.	36	
AM-03 The tool executes in execution environment XE.	56	
AM-04 If clone creation is specified, the tool creates a clone of the digital source.	16	
AM-05 If image file creation is specified, the tool creates an image file on file system type FS.	20	
AM-06 All visible sectors are acquired from the digital source.	36	3.3
AM-08 All sectors acquired from the digital source are acquired accurately.	36	3.1
AM-09 If unresolved errors occur while reading from the selected digital source, the tool notifies the user of the error type and location within the digital source.	1	
AM-10 If unresolved errors occur while reading from	1	

Assertions Tested	Tests	Anomaly
the selected digital source, the tool uses a benign fill in the destination object in place of the inaccessible data.		
AO-01 If the tool creates an image file, the data represented by the image file is the same as the data acquired by the tool.	20	
AO-02 If an image file format is specified, the tool creates an image file in the specified format.	3	
AO-04 If the tool is creating an image file and there is insufficient space on the image destination device to contain the image file, the tool shall notify the user.	1	
AO-05 If the tool creates a multi-file image of a requested size then all the individual files shall be no larger than the requested size.	20	
AO-10 If there is insufficient space to contain all files of a multi-file image and if destination device switching is supported, the image is continued on another device.	1	
AO-11 If requested, a clone is created during an acquisition of a digital source.	16	
AO-12 If requested, a clone is created from an image file.	20	
AO-13 A clone is created using access interface DST-AI to write to the clone device.	36	
AO-14 If an unaligned clone is created, each sector written to the clone is accurately written to the same disk address on the clone that the sector occupied on the digital source.	35	3.1, 3.2
AO-17 If requested, any excess sectors on a clone destination device are not modified.	12	
AO-19 If there is insufficient space to create a complete clone, a truncated clone is created using all available sectors of the clone device.	2	
AO-20 If a truncated clone is created, the tool notifies the user.	2	
AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.	56	
AO-24 If the tool executes in a forensically safe execution environment, the digital source is unchanged by the acquisition process.	36	

Two test assertions only apply in special circumstances. The assertion AO-22 is checked only for tools that create block hashes. The assertion AO-24 is only checked if the tool is executed in a run time environment that does not modify attached storage devices, such as MS-DOS. In normal operation, an imaging tool is used in conjunction with a write block device to protect the source drive. Table 4 lists the assertions that were not tested, usually due to the tool not supporting some optional feature, e.g., creation of cylinder-aligned clones.

**Table 4. Assertions not Tested**

<b>Assertions not Tested</b>
AM-07 All hidden sectors are acquired from the digital source.
AO-03 If there is an error while writing the image file, the tool notifies the user.
AO-06 If the tool performs an image file integrity check on an image file that has not been changed since the file was created, the tool shall notify the user that the image file has not been changed.
AO-07 If the tool performs an image file integrity check on an image file that has been changed since the file was created, the tool shall notify the user that the image file has been changed.
AO-08 If the tool performs an image file integrity check on an image file that has been changed since the file was created, the tool shall notify the user of the affected locations.
AO-09 If the tool converts a source image file from one format to a target image file in another format, the acquired data represented in the target image file is the same as the acquired data in the source image file.
AO-15 If an aligned clone is created, each sector within a contiguous span of sectors from the source is accurately written to the same disk address on the clone device relative to the start of the span as the sector occupied on the original digital source. A span of sectors is defined to be either a mountable partition or a contiguous sequence of sectors not part of a mountable partition. Extended partitions, which may contain both mountable partitions and unallocated sectors, are not mountable partitions.
AO-16 If a subset of an image or acquisition is specified, all the subset is cloned.
AO-18 If requested, a benign fill is written to excess sectors of a clone.
AO-21 If there is a write error during clone creation, the tool notifies the user.
AO-22 If requested, the tool calculates block hashes for a specified block size during an acquisition for each block acquired from the digital source.

### **3.1 Cloned or Restored NTFS Partitions**

When the tool cloned an NTFS partition, test case DA-02-NT, and when the image files of previously acquired NTFS partitions were restored, test cases DA-14-NT and DA-14-NT-ALT, some sectors on the target partitions did not match the partitions that were acquired. These changes were made by the Windows operating system, not X-Ways; an artifact of the tool's operating environment (Windows 7 and Windows XP). In test case DA-14-NT where the tool was run from Windows 7, 43,961 sectors differed. In test cases DA-02-NT and DA-14-NT-ALT where the tool was run from Windows XP, 147 and 139 sectors differed.

### **3.2 Restoring Images of Partitions With FAT32 and exFAT**

X-Ways can be used to restore the image of a partition. In testing the tool three methods were used:

- 1) the image was restored to a logical drive

- 2) the image was restored to a partition formatted with a file system
- 3) the image was restored to an unformatted partition

When images of FAT32 and exFAT partitions were restored using methods 1 and 2 three sectors differed between the images and the target partitions. These were changes to file system metadata made by the Windows operating system. When method 3 was used all sectors matched. This is not an issue with the tool; this result is noted to make the reader aware of the difference between restoring an image of a partition to a logical drive vs. restoring an image of a partition to a partition formatted with a file system vs. restoring an image of a partition to an unformatted partition.

### ***3.3 Acquiring a Logical Drive Does Not Acquire Volume Slack***

Selecting to acquire a Windows drive letter or logical drive (e.g., c: or e:) does not acquire volume slack. To acquire volume slack the partition must be selected and not the drive letter. In test case DA-07-NT where the tool user selected to acquire the Windows drive letter, eight unused sectors at the end of the partition containing the NTFS file system were not acquired. The partition had 27,744,192 sectors but the tool acquired only 27,744,184 sectors, skipping the last eight sectors of volume slack. When the partition was selected instead of the logical drive, test cases DA-02-NT and DA-07-NT-ALT, all sectors were acquired. This is not an issue with the tool; this result is noted to make the reader aware of the difference between choosing a logical vs. a partition acquisition.

## **4 Testing Environment**

The tests were run in the NIST CFTT lab. This section describes the selected test execution environments, computers available for testing, using the support software, and notes on other test hardware.

### ***4.1 Execution Environment***

The tool was executed in the MS Windows XP Pro 32-bit (Version 5.1.2600) and MS Windows 7 Ultimate 32-bit (Version 6.1.7600) environments.

### ***4.2 Test Computers***

Four computers were used to run the tool: **Freddy**, **Frank**, **DeathStar** and **Nihilus**.

**Freddy** and **Frank** have the following configuration:

Intel Desktop Motherboard D865GB/D865PERC (with ATA-6 IDE on board controller)  
BIOS Version BF86510A.86A.0053.P13  
Adaptec SCSI BIOS V3.10.0  
Intel® Pentium™ 4 CPU 3.4Ghz  
2577972KB RAM  
SONY DVD RW DRU-530A, ATAPI CD/DVD-ROM drive  
1.44 MB floppy drive  
Two slots for removable IDE hard disk drives

Two slots for removable SATA hard disk drives  
Two slots for removable SCSI hard disk drives

**DeathStar** and **Nihilus** have the following configuration:

TCP Custom built  
ULT U12-40670 ULTRA PRODUCTS FULL TOWER ATX 2  
ASU P8Z68VPRO/G ASUS P8Z68-V PRO/GEN3 SOCKET 1155 MB

IOC SY-PEX40040 I/O CREST 1 + 1 PORT SATA/ESATA III CARD  
CM EXTREME600W COOLERMMASTER EXTREME 600W PS

### **4.3 Support Software**

A package of programs to support test analysis, FS-TST Release 2.0, was used. The software can be obtained from: <http://www.cfft.nist.gov/diskimaging/fs-tst20.zip>.

### **4.4 Test Drive Creation**

There are three ways that a hard drive may be used in a tool test case: as a source drive that is imaged by the tool, as a media drive that contains image files created by the tool under test, or as a destination drive on which the tool under test creates a clone of the source drive. In addition to the operating system drive formatting tools, some tools (**diskwipe** and **diskhash**) from the FS-TST package are used to setup test drives.

#### **4.4.1 Source Drive**

The setup of most source drives follows the same general procedure, but there are several steps that may be varied depending on the needs of the test case.

1. The drive is filled with known data by the **diskwipe** program from FS-TST. The **diskwipe** program writes the sector address to each sector in both C/H/S and LBA format. The remainder of the sector bytes is set to a constant fill value unique for each drive. The fill value is noted in the **diskwipe** tool log file.
2. The drive may be formatted with partitions as required for the test case.
3. An operating system may optionally be installed.
4. A set of reference hashes is created by the FS-TST **diskhash** tool. These include both SHA1 and MD5 hashes. In addition to full drive hashes, hashes of each partition may also be computed.
5. If the drive is intended for hidden area tests (DA-08), an HPA, a DCO or both may be created. The **diskhash** tool is then used to calculate reference hashes of just the visible sectors of the drive.

The source drives for DA-09 are created such that there is a consistent set of faulty sectors on the drive. Each of these source drives is initialized with **diskwipe** and then their faulty sectors are activated. For each of these source drives, a duplicate drive, with no faulty sectors, serves as a reference drive for comparison.

#### **4.4.2 Media Drive**

To setup a media drive, the drive is formatted with one of the supported file systems. A media drive may be used in several test cases.

#### **4.4.3 Destination Drive**

To setup a destination drive, the drive is filled with known data by the **diskwipe** program from FS-TST. Partitions may be created if the test case involves restoring from the image of a logical acquire.

### **4.5 Test Drive Analysis**

For test cases that create a clone of a physical device, e.g., DA-01, DA-04, etc., the destination drive is compared to the source drive with the **diskcmp** program from the FS-TST package; for test cases that create a clone of a logical device, i.e., a partition, e.g., DA-02, DA-20, etc., the destination partition is compared to the source partition with the **partcmp** program. For a destination created from an image file, e.g., DA-14, the destination is compared, using either **diskcmp** (for physical device clones) or **partcmp** (for partition clones), to the source that was acquired to create the image file. Both **diskcmp** and **partcmp** note differences between the source and destination. If the destination is larger than the source it is scanned and the excess destination sectors are categorized as either, undisturbed (still containing the fill pattern written by **diskwipe**), zero filled or changed to something else.

For test case DA-09, imaging a drive with known faulty sectors, the program **anabad** is used to compare the faulty sector reference drive to a cloned version of the faulty sector drive.

For test cases such as DA-06 and DA-07 any acquisition hash computed by the tool under test is compared to the reference hash of the source to check that the source is completely and accurately acquired.

### **4.6 Note on Test Drives**

The testing uses several test drives from a variety of vendors. The drives are identified by an external label that consists of a two digit hexadecimal value and an optional tag, e.g., 25-SATA. The combination of hex value and tag serves as a unique identifier for each drive. The two digit hex value is used by the FS-TST **diskwipe** program as a sector fill value. The FS-TST compare tools, **diskcmp** and **partcmp**, count sectors that are filled with the source and destination fill values on a destination that is larger than the original source.

## 5 Test Results

The main item of interest for interpreting the test results is determining the conformance of the device with the test assertions. Conformance with each assertion tested by a given test case is evaluated by examining the **Log Highlights** box of the test report.

### 5.1 Test Results Report Key

The following table presents an explanation of each section of the test details in section 5.2. The Tester Name, Test Host, Test Date, Drives, Source Setup and Log Highlights sections for each test case are populated by excerpts taken from the log files produced by the tool under test and the FS-TST tools that were executed in support of test case setup and analysis.

Heading	Description
First Line:	Test case ID, name, and version of tool tested.
Case Summary:	Test case summary from <i>Digital Data Acquisition Tool Assertions and Test Plan Version 1.0</i> .
Assertions:	The test assertions applicable to the test case, selected from <i>Digital Data Acquisition Tool Assertions and Test Plan Version 1.0</i> .
Tester Name:	Name or initials of person executing test procedure.
Test Host:	Host computer executing the test.
Test Date:	Time and date that test was started.
Drives:	Source drive (the drive acquired), destination drive (if a clone is created) and media drive (to contain a created image).
Source Setup:	Layout of partitions on the source drive and the expected hash of the drive.
Log Highlights:	Information extracted from various log files to illustrate conformance or non-conformance to the test assertions.
Results:	Expected and actual results for each assertion tested.
Analysis:	Whether or not the expected results were achieved.

### 5.2 Test Details

The test results are presented in this section.

#### 5.2.1 DA-01-ATA28

Test Case DA-01-ATA28 X-Ways Forensics 16.2 SR-5	
Case Summary:	DA-01 Acquire a physical device using access interface AI to an unaligned clone.
Assertions:	AM-01 The tool uses access interface SRC-AI to access the digital source. AM-02 The tool acquires digital source DS. AM-03 The tool executes in execution environment XE. AM-04 If clone creation is specified, the tool creates a clone of the digital source. AM-06 All visible sectors are acquired from the digital source. AM-08 All sectors acquired from the digital source are acquired accurately. AO-11 If requested, a clone is created during an acquisition of a digital source.

Test Case DA-01-ATA28 X-Ways Forensics 16.2 SR-5																													
	<p>AO-13 A clone is created using access interface DST-AI to write to the clone device.</p> <p>AO-14 If an unaligned clone is created, each sector written to the clone is accurately written to the same disk address on the clone that the sector occupied on the digital source.</p> <p>AO-17 If requested, any excess sectors on a clone destination device are not modified.</p> <p>AO-22 If requested, the tool calculates block hashes for a specified block size during an acquisition for each block acquired from the digital source.</p> <p>AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.</p> <p>AO-24 If the tool executes in a forensically safe execution environment, the digital source is unchanged by the acquisition process.</p>

Test Case DA-02-F12 X-Ways Forensics 16.2 SR-5	
Case Summary:	DA-02 Acquire a digital source of type DS to an unaligned clone.
Assertions:	<p>AM-01 The tool uses access interface SRC-AI to access the digital source.</p> <p>AM-02 The tool acquires digital source DS.</p> <p>AM-03 The tool executes in execution environment XE.</p> <p>AM-04 If clone creation is specified, the tool creates a clone of the digital source.</p> <p>AM-06 All visible sectors are acquired from the digital source.</p> <p>AM-08 All sectors acquired from the digital source are acquired accurately.</p> <p>AO-11 If requested, a clone is created during an acquisition of a digital source.</p> <p>AO-13 A clone is created using access interface DST-AI to write to the clone device.</p> <p>AO-14 If an unaligned clone is created, each sector written to the clone is accurately written to the same disk address on the clone that the sector occupied on the digital source.</p> <p>AO-17 If requested, any excess sectors on a clone destination device are not modified.</p> <p>AO-22 If requested, the tool calculates block hashes for a specified block size during an acquisition for each block acquired from the digital source.</p> <p>AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.</p> <p>AO-24 If the tool executes in a forensically safe execution environment, the digital source is unchanged by the acquisition process.</p>

## 5.2.13 DA-02-F32X

Test Case DA-02-F32X X-Ways Forensics 16.2 SR-5	
Case Summary:	DA-02 Acquire a digital source of type DS to an unaligned clone.
Assertions:	<p>AM-01 The tool uses access interface SRC-AI to access the digital source.</p> <p>AM-02 The tool acquires digital source DS.</p> <p>AM-03 The tool executes in execution environment XE.</p> <p>AM-04 If clone creation is specified, the tool creates a clone of the digital source.</p> <p>AM-06 All visible sectors are acquired from the digital source.</p> <p>AM-08 All sectors acquired from the digital source are acquired accurately.</p> <p>AO-11 If requested, a clone is created during an acquisition of a digital source.</p> <p>AO-13 A clone is created using access interface DST-AI to write to the clone device.</p> <p>AO-14 If an unaligned clone is created, each sector written to the clone is accurately written to the same disk address on the clone that the sector occupied on the digital source.</p> <p>AO-17 If requested, any excess sectors on a clone destination device are not modified.</p> <p>AO-22 If requested, the tool calculates block hashes for a specified block size during an acquisition for each block acquired from the digital source.</p> <p>AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.</p> <p>AO-24 If the tool executes in a forensically safe execution environment, the digital source is unchanged by the acquisition process.</p>

## 5.2.24 DA-07-CF

Test Case DA-07-CF X-Ways Forensics 16.2 SR-5							
Case Summary:	DA-07 Acquire a digital source of type DS to an image file.						
Assertions:	<p>AM-01 The tool uses access interface SRC-AI to access the digital source.</p> <p>AM-02 The tool acquires digital source DS.</p> <p>AM-03 The tool executes in execution environment XE.</p> <p>AM-05 If image file creation is specified, the tool creates an image file on file system type FS.</p> <p>AM-06 All visible sectors are acquired from the digital source.</p> <p>AM-08 All sectors acquired from the digital source are acquired accurately.</p> <p>AO-01 If the tool creates an image file, the data represented by the image file is the same as the data acquired by the tool.</p> <p>AO-05 If the tool creates a multi-file image of a requested size then all the individual files shall be no larger than the requested size.</p> <p>AO-22 If requested, the tool calculates block hashes for a specified block size during an acquisition for each block acquired from the digital source.</p> <p>AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.</p> <p>AO-24 If the tool executes in a forensically safe execution environment, the digital source is unchanged by the acquisition process.</p>

## 5.2.28 DA-07-F32

Test Case DA-07-F32 X-Ways Forensics 16.2 SR-5	
Case Summary:	DA-07 Acquire a digital source of type DS to an image file.
Assertions:	<p>AM-01 The tool uses access interface SRC-AI to access the digital source.</p> <p>AM-02 The tool acquires digital source DS.</p> <p>AM-03 The tool executes in execution environment XE.</p> <p>AM-05 If image file creation is specified, the tool creates an image file on file system type FS.</p> <p>AM-06 All visible sectors are acquired from the digital source.</p> <p>AM-08 All sectors acquired from the digital source are acquired accurately.</p> <p>AO-01 If the tool creates an image file, the data represented by the image file is the same as the data acquired by the tool.</p> <p>AO-05 If the tool creates a multi-file image of a requested size then all the individual files shall be no larger than the requested size.</p> <p>AO-22 If requested, the tool calculates block hashes for a specified block size during an acquisition for each block acquired from the digital source.</p> <p>AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.</p> <p>AO-24 If the tool executes in a forensically safe execution environment, the digital source is unchanged by the acquisition process.</p>

Test Case DA-13 X-Ways Forensics 16.2 SR-5					
Case Summary:	DA-13 Create an image file where there is insufficient space on a single volume, and use destination device switching to continue on another volume.				
Assertions:	<p>AM-01 The tool uses access interface SRC-AI to access the digital source.</p> <p>AM-02 The tool acquires digital source DS.</p> <p>AM-03 The tool executes in execution environment XE.</p> <p>AM-05 If image file creation is specified, the tool creates an image file on file system type FS.</p> <p>AM-06 All visible sectors are acquired from the digital source.</p> <p>AM-08 All sectors acquired from the digital source are acquired accurately.</p> <p>AO-01 If the tool creates an image file, the data represented by the image file is the same as the data acquired by the tool.</p> <p>AO-04 If the tool is creating an image file and there is insufficient space on the image destination device to contain the image file, the tool shall notify the user.</p> <p>AO-05 If the tool creates a multi-file image of a requested size then all the individual files shall be no larger than the requested size.</p> <p>AO-10 If there is insufficient space to contain all files of a multi-file image and if destination device switching is supported, the image is continued on another device.</p> <p>AO-22 If requested, the tool calculates block hashes for a specified block size during an acquisition for each block acquired from the digital source.</p> <p>AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.</p> <p>AO-24 If the tool executes in a forensically safe execution environment, the digital source is unchanged by the acquisition process.</p>

## 5.2.47 DA-14-F32

Test Case DA-14-F32 X-Ways Forensics 16.2 SR-5	
Case Summary:	DA-14 Create an unaligned clone from an image file.
Assertions:	<p>AM-03 The tool executes in execution environment XE.</p> <p>AO-12 If requested, a clone is created from an image file.</p> <p>AO-13 A clone is created using access interface DST-AI to write to the clone device.</p> <p>AO-14 If an unaligned clone is created, each sector written to the clone is accurately written to the same disk address on the clone that the sector occupied on the digital source.</p> <p>AO-17 If requested, any excess sectors on a clone destination device are not modified.</p> <p>AO-23 If the tool logs any log significant information, the information is accurately recorded in the log file.</p>
